

Do Vegetarians and Vegans Eat Enough Protein?

By Naomi Imatome-Yun
March 30 2015

Dr. Michael Greger answers the question that vegans and vegetarians hear all the time. In his video below, he breaks down how much [protein](#) we need versus how much protein we eat.

Do Vegetarians Get Enough Protein?

- The average recommended intake of protein is 42 grams a day.
- Non-vegetarians eat way more than that (almost 80 grams), but **so does everyone else**.
- Vegetarians and vegans actually average 70 percent more protein than they need every day (over 70 grams).

There is so much fuss over protein, even though the studies Dr. Greger cites in the video show that 97 percent of Americans eat enough protein.

Americans Don't Eat Enough Fiber

Everyone is so concerned about protein, but what we really need to be concerned about is dietary fiber.

Virtually all Americans get enough [protein](#), but less than 3 percent of Americans get the minimum recommended intake of fiber.

Why Is Fiber So Important?

A lack of dietary fiber has been associated with a higher risk of diabetes, cardiovascular disease, obesity, and various cancers, as well as higher cholesterol, blood pressure, and blood sugar.

Why Aren't Americans Eating Enough Fiber?

Fiber is found only in plants, like beans, fruits, vegetables, whole grains.

Nearly the entire United States population fails to eat enough whole plant foods.

Watch the entire Nutritionfacts.org video to learn more about how to close the fiber gap and how to spread the word about eating a plant-based diet for better health and wellbeing.
